Flammable and Combustible Liquids
Introduction

- The two primary hazards associated with flammable and combustible liquids are explosion and fire.

- Safe handling and storage of flammable liquids requires the use of approved equipment and practices per OSHA standards.
Flash Point

- **Flash point** means the minimum temperature at which a liquid gives off enough vapor to form an ignition.

- In general, the lower the flash point, the greater the hazard.

- **Flammable liquids** have flash points below 100°F, and are more dangerous than combustible liquids, since they may be ignited at room temperature.

- **Combustible liquids** have flash points at or above 100°F.

- Although combustible liquids have higher flash points than flammable liquids, they can pose serious fire and/or explosion hazards when heated.
Classes of Flammable and Combustible Liquids

Program Components

A good plan for safe use of flammable and combustible liquids contains at least these components:

- Control of ignition sources
- Proper storage
- Fire control
- Safe handling
Controlling Fires

Fire Triangle

Oxygen

Heat

Chemical Reaction

Fuel
Sources of Ignition

Must take adequate precautions to prevent ignition of flammable vapors. Some sources of ignition include:

- Open flames
- Smoking
- Static electricity
- Cutting and welding
- Hot surfaces
- Electrical and mechanical sparks
- Lightning
Static Electricity

- Generated when a fluid flows through a pipe or from an opening into a tank
- Main hazards are fire and explosion from sparks containing enough energy to ignite flammable vapors
- Bonding or grounding of flammable liquid containers is necessary to prevent static electricity from causing a spark
Bonding

- Physically connect two conductive objects together with a bond wire to eliminate a difference in static charge potential between them.
- Must provide a bond wire between containers during flammable liquid filling operations, unless a metallic path between them is otherwise present.
Grounding

- Eliminates a difference in static charge potential between conductive objects and ground.
- Although **bonding** will eliminate a difference in potential between objects, it will not eliminate a difference in potential between these objects and earth unless one of the objects is connected to earth with a ground wire.
Ventilation

Always provide adequate ventilation to reduce the potential for ignition of flammable vapors.
Storage Fundamentals

- Identify incompatible chemicals – check the Material Safety Data Sheet
- Isolate and separate incompatible materials
  - Isolate by storing in another area or room
  - Degree of isolation depends on quantities, chemical properties and packaging
  - Separate by storing in same area or room, but apart from each other
NFPA Label

Health (blue)
4 – deadly
3 – extreme danger
2 – hazardous
1 – slightly hazardous
0 – normal material

Specific Hazard
OXY - oxidizer
ACID – acid
ALK – Alkali
COR – corrosive
W – use no water
RAD - radiation haz.

Fire Hazard (red)
Flash Point Temp.
4 – below 73F - v.flam.
3 – 73 to 100F – flam.
2 – 101 to 200F- comb.
1 – over 200F –slightly combustible
0 – will not burn

Reactivity (yellow)
4 – may detonate
3 – shock or heat may detonate
2 – violent chem. reaction
1 – unstable if heated
0 – stable
Storage of Flammable and Combustible Liquids

- Storage must not limit the use of exits, stairways, or areas normally used for the safe egress of people.

- In office occupancies:
  - Storage prohibited except that which is required for maintenance and operation of equipment.
  - Storage must be in:
    - closed metal containers inside a storage cabinet, or
    - safety cans, or
    - an inside storage room.
Safety Cans for Storage and Transfer

- Approved container of not more than 5 gallons capacity
- Spring-closing lid and spout cover
- Safely relieves internal pressure when exposed to fire
Flame Arrester Screen

- Prevents fire flashback into can contents
- Double wire-mesh construction
- Large surface area provides rapid dissipation of heat from fire so that vapor temperature inside can remains below ignition point
Storage Cabinets

- Not more than 60 gal of Class I and/or Class II liquids, or not more than 120 gal of Class III liquids permitted in a cabinet.

- Must be conspicuously labeled, “Flammable - Keep Fire Away”.

- Doors on metal cabinets must have a three-point lock (top, side, and bottom), and the door sill must be raised at least 2 inches above the bottom of the cabinet.
Fire Control

- Suitable fire control devices, such as small hose or portable fire extinguishers must be available where flammable or combustible liquids are stored.
- Open flames and smoking must not be permitted in these storage areas.
- Materials which react with water must not be stored in the same room with flammable or combustible liquids.
Transferring Flammable Liquids

Since there is a sizeable risk whenever flammable liquids are handled, OSHA allows only four methods for transferring these materials:

- Through a closed piping system
- From safety cans
- By gravity through an approved self-closing safety faucet
- By means of a safety pump
Self-Closing Safety Faucet

- Bonding wire between drum and container
- Grounding wire between drum and ground
- Safety vent in drum
Safety Pump

- Faster and safer than using a faucet
- Spills less likely
- No separate safety vents in drum required
- Installed directly in drum bung opening
- Some pump hoses have integral bonding wires
Waste and Residue

Combustible waste and residue must be kept to a minimum, stored in covered metal receptacles and disposed of daily.

- Waste drum with disposal funnel
- Safety disposal can
- Oily-waste can (self-closing lid)
HAZARDOUS CHEMICAL DISPOSAL

- Use Proper Chemical Disposal Methods
- Controlled Waste
  - Used oil & used antifreeze
- Hazardous Waste
  - Paint & thinner
  - Solvent & cleaners
Safe Handling Fundamentals

- Carefully read the manufacturer’s label on the flammable liquid container before storing or using it.
- Practice good housekeeping in flammable liquid storage areas.
- Clean up spills immediately, then place the cleanup rags in a covered metal container.
- Only use approved metal safety containers or original manufacturer’s container to store flammable liquids.
- Keep the containers closed when not in use and store away from exits or passageways.
- Use flammable liquids only where there is plenty of ventilation.
- Keep flammable liquids away from ignition sources such as open flames, sparks, smoking, cutting, welding, etc.
The two primary hazards associated with flammable and combustible liquids are explosion and fire.

Safe handling and storage of flammable liquids requires the use of approved equipment and practices per OSHA standards.

1. Flammable liquids have a flash point below 100 degrees F? True or False
2. Physically connecting two conductive objects together is called grounding? True or False
3. What’s the best source to identify incompatible chemicals? ______________
4. Flammability on the NFPA label is colored Red? True or False
5. Flammable safety cans:
   a. cannot be more than 60 gal.
   b. Must have a self-closing lid
   c. Must be made of durable plastic
1. Flammable liquids have a flash point below 100 degrees F? **True** or **False**

2. Physically connecting two conductive objects together is called grounding? **True** or **False**

3. What’s the best source to identify incompatible chemicals? **MSDS**

4. Flammability on the NFPA label is colored Red? **True** of **False**

5. Flammable safety cans:
   a. cannot be more than 60 gal.
   b. **Must have a self-closing lid**
   c. Must be made of durable plastic
